2028_REC_OOPS using Java_Week 8_Q1

Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotException
AtTheRateException
DomainException

A typical email address should have a "." character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

Input Format

The first line of input contains the email to be validated.

Output Format

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

Sample Test Case

Input: sample@gmail.com

Output: Valid email address

Answer

```
// You are using Scanner
import java.util.Scanner;

class DotException extends Exception {
    DotException(String msg) {
        super(msg);
    }
}

class AtTheRateException extends Exception {
    AtTheRateException(String msg) {
        super(msg);
    }
}

class DomainException extends Exception {
    DomainException(String msg) {
        super(msg);
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String email = sc.nextLine();
        try {
            validateEmail(email);
            System.out.println("Valid email address");
        } catch (DotException e) {
            System.out.println(e.getClass().getSimpleName() + ": " + e.getMessage()
+ " Invalid email address");
        } catch (AtTheRateException e) {
```

```

        System.out.println(e.getClass().getSimpleName() + ": " + e.getMessage()
+ " Invalid email address");
    } catch (DomainException e) {
        System.out.println(e.getClass().getSimpleName() + ": " + e.getMessage()
+ " Invalid email address");
    }
}

```

```

static void validateEmail(String email) throws DotException,
AtTheRateException, DomainException {
    if(email.startsWith(".") || email.endsWith(".") || email.startsWith("@") ||
email.endsWith("@"))
        throw new DotException("Invalid Dot usage");

```

```

    int atCount = 0;
    for (char ch : email.toCharArray()) {
        if (ch == '@') atCount++;
    }
    if (atCount != 1)
        throw new AtTheRateException("Invalid @ usage");

```

```

    int atIndex = email.indexOf('@');
    String afterAt = email.substring(atIndex + 1);

```

```

    if(afterAt.startsWith(".") || afterAt.endsWith("."))
        throw new DotException("Invalid Dot usage");

```

```

    int dotCountAfterAt = 0;
    for(char ch : afterAt.toCharArray()){
        if(ch == '.') dotCountAfterAt++;
    }
    if(dotCountAfterAt != 1)
        throw new DotException("Invalid Dot usage");

```

```

    int lastDotIndex = email.lastIndexOf('.');
    if(lastDotIndex < atIndex)
        throw new DotException("Invalid Dot usage");

```

```

    String domain = email.substring(lastDotIndex + 1);
    if(!(domain.equals("in") || domain.equals("com") || domain.equals("net") ||
domain.equals("biz")))
        throw new DomainException("Invalid Domain");

```

```
        if(email.contains("..") || email.contains("@@") || email.contains(".@" ||  
email.contains("@."))  
            throw new DotException("Invalid Dot usage");  
    }  
}
```

Status : Correct
